

One group may submit one presentation. The presentation schedule will be shared shortly.

Guidelines:

Here are the guidelines for your SLR presentation. Each group will have **15 minutes** to present. The goal is not to present all papers, but is to present the insights, patterns and logic. Your presentation should have a structure with clear technical story telling. Note that although you will be presenting in the group, these presentations will be **graded individually**.

1. Title, Outline and Context

- Topic of your SLR
- Why this area matters (1–2 strong sentences) and may be some simple yet appealing visualizations
- Your objective:
This study systematically reviews ~100 papers to identify trends, state-of-the-art methods, and research gaps.

2. Methodology – PRISMA based

Mainly covers

- Databases used (e.g., IEEE, ACM, Scholar, etc.)
- Keywords / search strategy (queries used, and why these queries, any hurdles faced)
- Inclusion / exclusion criteria
- Time range etc
- PRISMA Diagram (keep more visuals in the presentations, remember *a picture is worth more than a 1000 words*)
 - Initial papers → screened → final ~100 papers
 - Emphasize:
 - Transparency
 - Reproducibility

3. Dataset Overview (*Again remember, good visuals is the key for communication here*)

Give audience a *mental map* of your literature:

- Papers by year (trend: increasing/decreasing?)
- Distribution by:
 - Methods
 - Domains / applications
- Maybe 1–2 simple charts:

- Bar graph / pie chart
- Discuss the evolution of the field in the window of your search (e.g., from ML to DL, and why)

4. State of the Art (*this is your main section*)

Group the papers based on their areas and themes, you may use a table or some visualizations

Example:

- Category 1: Traditional approaches
- Category 2: Deep learning / advanced methods
- Category 3: Hybrid / emerging techniques

For each category:

- What approaches are used?
- Strengths
- Limitations

Give a take home to the audience i.e., *In summary, the state of the art has improved on — but still struggles with —.*

5. Key Insights / Synthesis

This part is far more than a flat summary. This is where you show *your thinking*.

Examples:

- Common patterns across studies
- What works consistently
- What doesn't scale / generalize
- Hidden trends:
 - Data issues?
 - Evaluation inconsistencies?

6. Research Gaps and Research Questions for the future researchers of the field

Example research gaps:

- Gap 1: (e.g., lack of real-world datasets)
- Gap 2: (e.g., poor generalization)
- Gap 3: (e.g., lack of standardized evaluation)

Later link each gap to the future opportunity

7. Conclusion

- 2–3 takeaway points:
 - What we learned
 - Where the field is heading
- Optional:
 - Your future work / thesis direction
